Algebra Review Package Cont'd

Solve the following problems. Final answer must be simplified.

1. George bought 3 items at the store. The first item costs x dollars, the second item costs triple the first item, and the third item costs a quarter as much as the first item. Give the algebraic expression to represent the average of these three items.

1	2	3
x	$3x$	$\frac{1}{4}x$

$$\frac{x + 3x + .25x}{3} = \frac{4.25x}{3} = 1.42x$$

2. Isabelle got $12x + 28$ new hockey cards. She kept 10 cards and gave the rest to her 3 younger brothers. What is the algebraic expression representing the number of cards each brother received?

$$\frac{(12x + 28) - 10}{3} = \frac{12x + 18}{3} = 4x + 6$$

3. If n represents the smallest of 3 consecutive whole numbers, what is the algebraic expression for the sum of these 3 numbers?

1	2	3
n	$n+1$	$n+2$

$$(n) + (n+1) + (n+2) = 3n + 3$$

4. Claire is 10 years older than twice Eliza's age, and Philippe's age is 40 years less than three times Claire's age. What algebraic expression represents the average age if these three people?

C	E	P
$2x+10$	x	$3(2x+10) - 40$

$$\frac{(2x+10) + (x) + (3(2x+10) - 40)}{3} = \frac{9x + 6}{3} = 3x + 2$$

5. At a flower shop, a rose costs \$1.50 more than a carnation. Rebecca buys eight roses and five carnations to make a bouquet of flowers. What algebraic expression represents the total cost of the bouquet?

R	C
$x+1.5$	x

$$8(x+1.5) + 5(x) = 8x + 12 + 5x = 13x + 12$$

6. The length of a rectangular field is 5m more than twice its width. What algebraic expression represents the perimeter of this rectangle?

$$P = L + L + W + W$$

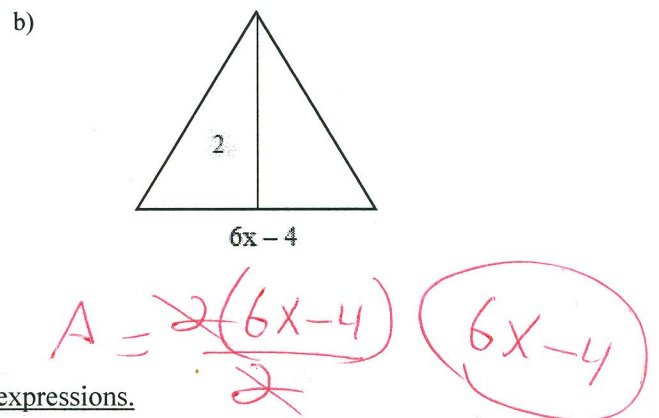

$$P = 2x + 5 + 2x + 5 + x + x = 6x + 10$$
